Score

Result No.

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

```
The invention relates to new synthetic peptides comprising at least one amino acid sequence comprising an HIV gag protein T-cell epitope linked at the T-or N-terminus to an amino acid sequence comprising a B-cell epitope of the V3 loop of an HIV env protein, which can be used to generate vaccines against HIV-1. The T-cell epitope sequence is pref. selected from the T-helper determinant core peptides P248, P244, p244, p244 while the B-cell epitopes are derived from HIV strains including CTLB-56, V3MN, CTLB-29, CTLB-55, SF2, LAI, IIIB, RF, Z6, 2054, T14 and BX08. The sequence represents and can be linked to a branched Lys backbone. This sequence represents and can be linked to a branched CT-belper determinant core peptide T5 (AAW25881) which corresponds to a corresponds to a peptide generated from the consensus sequence of the New York and Amsterdam HIV-1 isolates. The B-cell epitope is linked to the N-terminus of the T-helper peptide. (Updated on 25-MAR-2003 to correct PF field.)
                                                                                                                                                                                                                                                                ä
               These peptide sequences may also be used in the production of multimeric peptides in which the peptides are C-terminally modified by the addition of a Lys residue which is modified on its epsilon amino acid to carry an additional copy of the peptide molecule. The linear and multimeric peptides may be used for the treatment of AIDS by acting to displace the binding of HIV virus to human or animal cells or by disturbing the 3D organisation of the virus. (Updated on 25-MMR-2003 to correct PN field.) (Updated on 16-OCT-2003 to standardise OS field)
 peptides such as this, may be used in the production of HIV-1 vaccines
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     HIV; human immunodeficiency virus; gag; T-cell; B-cell; epitope; env; V3 loop; vaccine; determinant; chimaeric.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Tandem synthetic HIV peptide(s) useful as immunogens - comprising gag protein T-cell epitope linked to env protein B-cell epitope.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The invention relates to a novel immunogenic composition for use in vaccines for the treatment of HIV-1 comprising an HIV-1-derived T-cell epitope linked to an HIV-1-derived B-cell epitope. The T-cell epitopes are generally designed based on the p24 core protein and the B-cell epitopes from the V3 loop of the gpl20 protein from various HIV-1 extrains. This peptide corresponds to a fusion of the T5 epitope (AAMW7397) and the V3 loop B-cell epitope (AAW87397) and the V3 loop B-cell epitope (AAW87365) which is a consensus V3 loop peptide of the New York and Amsterdam HIV-1 isolates

the immunogenic composition of the invention. The composition comprises a synthetic fusion polypeptide which includes a sequence encoding 1 or more T cell epitopes and a sequence encoding 1 or more perfect both the T cell and B cell epitopes are derived from HIV proteins. The compositions are useful as vaccines against HIV infection. The composition induces HIV-1-specific polyclonal antibodies that are opsonising and antiviral. The peptide components may be selected to induce a response against different viral isolates and in subjects who recognise different T cell epitopes. (Updated on 17-OCT-2003 to
                                                                                                                                                                                                                                                                              This sequence represents a fragment of a HIV1 protein, and can be used in
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         /note= "Modified at the epsilon N by the sequence given

This sequence represents the T-cell epitope derived from the HIV-1 core protein, T5, linked to consesus B-cell epitope, PRI which represents a consensus sequence derived from New York and Ametradam HIV-1 isolates. Chimeric peptides such as this, may be used in the production of HIV-1 vaccines. These peptides sequences may also be used in the production of HIV-1 multimeric peptides in which the peptides are C-terminally modified by the addition of a Lys residue which is modified on its epsilon amino acid to carry an additional copy of the peptide modecule. The linear and multimeric peptides may be used for the treatment of AIDS by acting to displace the binding of HIV wirus to human or animal cells or by displace the binding of the virus. (Updated on 25-MAR-2003 to correct PN field.) (Updated on 16-OCT-2003 to standardise OS field)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                HIV; human immunodeficiency virus; gag; T-cell; B-cell; epitope; env; V3 loop; vaccine; determinant; chimaeric.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Tandem synthetic HIV peptide(s) useful as immunogens - comprising gag protein T-cell epitope linked to env protein B-cell epitope.
                                                                                                                                                         Novel tandem synthetic HIV-1 peptide(s) - comprising T-cell epitope agg protein linked to B-cell epitope of V3 loop protein of an HIV-I isolate.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         DB 2; Length 33;

                                                                                                                                                                                                                                                                                                                                                                    contains four oppies a peptide monomer comprising the T-cell spitope derived from the HIV-1 core protein, T5, linked to the B-cell spitope, PRI which represents a commsensus sequence derived from New York and Amsterdam HIV-1 isolates. The entire multimer contains four copies of the same sequence linked through Lys residues. The B-cell epitope may be derived from HIV-1 proteins esp. gpi60, agg and pol proteins. These chimeric peptides may then be used in the production of HIV-1 vaccines. The linear and multimeric peptides may be used for the treatment of AIDS by acting to displace the binding of HIV virus to human called or by disturbing the 3D organisation of the virus.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             셤
                    amino acid sequence comprising an HIV gag protein T-call epitope linked at its C- or N-terminus to an amino acid sequence comprising an HIV gag protein T-call epitope linked epitope of the V3 loop of an HIV env protein, which can be used to generate vaccines against HIV-I. The T-cell epitope sequence is pref. selected from the T-helper determinant core peptides P24E, P24N, P24L, P24M and P24H while the B-cell epitopes are derived from HIV strains including CTLB-56, V3MN, CTLB-29, CTLB-55, SEZ, LAI, IIIB, RF, Z6, 2054, 1714 and BX08. The peptides are chimaeric and can be linked to a branched Lys backbone. This sequence represents a chimaeric peptide comprising the rhelper determinant core peptide T5 (AAM25881) with the HIV-1 strain MN env protein V3 loop B-cell epitope PRI which corresponds to a peptide generated from the consensus sequence of the New York and Amsterdam HIV-1 stoleting the Updated on 25-MAR-2003 to correct PF field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The invention relates to a novel immunogenic composition for use in vaccines for the treatment of HIV-1 comprising an HIV-1-derived T-cell epitope linked to an HIV-1-derived B-cell epitope. The T-cell epitopes are generally designed based on the p24 core protein and the B-cell epitopes from the V3 loop of the gp120 protein from various HIV-1 extrains. This peptide corresponds to a fusion of the T5 epitope (AAMW67397) and the V3 loop Becall epitope (AAMW67355) which is a consensus V3 loop peptide of the New York and Amsterdam HIV-1 isolates
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Immunogen; vaccine; HIV-1; T-cell; B-cell; epitope; core protein; gpl20;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The present invention describes a synthetic peptide comprising an amino acid sequence containing a T-cell epitope of an HIV gag protein linked a lits C terminus to an amino acid sequence containing a B-cell epitope of an HIV gp41 protein and containing the amino acid sequence: XILKDWX2; where XI = B, A, G or Q, and X2 = A or T, or an amino acid sequence capable of eliciting an HIV-specific antiserum and recognizing the sequence XILKDWX2. The synthetic peptide is useful in vaccines against HIV infection and in diagnostic applications. AAW98895 to AAW98999 to AAW99899 represent synthetic peptides from the present
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Gaps

```
contains four oppies a peptide monomer formprishing the T-cell epitope derived from the HIV-1 core protein, T5, linked to the B-cell epitope, PRI which represents a commsensus sequence derived from New York and Amsterdam HIV-1 isolates. The entire multimer contains four copies of the same sequence linked through Lys residues. The B-cell epitope may be derived from HIV-1 proteins esp. 199160, aga and pol proteins. These chimeric peptides may then be used in the production of HIV-1 vaccines. The linear and multimeric peptides may be used for the treatment of AIDS by acting to displace the binding of HIV virus to human or animal cells or by disturbing the 3D organisation of the virus. (Updated on 25-MAR-2003 to correct PN field.) (Updated on 16-OCT-2003 to standardise OS

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            ij
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           This sequence represents a fragment of a HIVI protein, and can be used in the immunogenic composition of the invention. The composition comprises a synthetic fusion polypeptide which includes a sequence encoding I or more I cell epitopes and a sequence encoding I or more B cell epitopes and a sequence encoding I or more B cell epitopes and a carrier. Both the T cell and B cell epitopes are derived from HIV proteins. The compositions are useful as vaccines against HIV infection. The composition induces HIV-1-specific polyclonal antibodies that are opposition induces HIV-1-specific polyclonal antibodies that are induce a response against different viral isolates and in subjects who recognise different T cell epitopes.                                                                                                                                                                                                                                                                                     Peptide RPI50 comprises segments of the Principal Neutralising Domain (envelope protein) from isolate AVR-2. The last Cys residue is added for the purpose of crosslinking to carrier proteins. Cysteine residues may be added, so that the residues at or near both ends form a disulfide bond, giving peptide a loop-like configuration, which can be utilised to enhance the immunogenic properties of the peptides. Protein is capable of eliciting, and/or binding with, neutralising Abs. The neutralising domain is bounded by cysteine residues which occur at positions 296 and 331. Peptides can be used as immunogens or screening reagents to generate or identify poly- or monoclonal antibodies. See also AARO4277-R04506 and AAQ04273-Q0450. The products of the invention have anti-viral and anti-HIV activity. Mixtures of structurally different viral proteins, that are sequence variants of a single protein are useful for production of vaccines for the prevention and/or therapy of viral infections in humans. The vaccines are especially useful for prevention and/or therapy of human immunodeficiency virus (HIV) infection in humans. The vectors and host cells are useful for the expression of the protein/DNA mixtures, which are also useful for preventing and/or therapy of viral infection. This sequence represents a SEP-2003 to standardise OS field)
                                                                                                                                                                                                                                                                                                                   Viral vaccine comprises a mixture of protein sequence variants of a single viral protein, which is useful for prevention and therapy of viral infections, especially HIV, in humans.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  gpl20; interaction; co-receptor; CXCR4; CCR5; refractive index; V3 loop;

Identifying compounds that modify interaction of gp120 and co-receptors, useful potentially for treating human immune deficiency virus infection, also new peptides.
```

Disclosure; Pig 2; 68pp; German.

This invention describes novel substances that modify the interaction between the gpl20 protein of human immunodeficiency virus (HIV), or its fragmants, with the co-receptors CXCR4, CCR5 and/or other 7-helix transmembrane receptors for HIV. The method comprises (a) immobilizing a ligand for the co-receptor on a gold surface; (b) contacting the ligand with suspended cells that express the co-receptor; and (c) determining interaction by measuring the refractive index (RI) by plasmon resonance. The procedure is repeated using cells that have been incubated with a test compound, and this is identified if RI is lower for cells that includes the amino acid sequence of an HIV v3 loop (including flanking Cys). The products of the invention have virucide and anti-HIV and/or treatment of HIV infection. This sequence represents an HIV-1 v3-loop region described in the disclosure of the invention. (Updated on 29-loop region described in the disclosure of the invention. (Updated on 29-loop region described in the disclosure of the invention.

Patent No. 5800822

GENERAL INFORMATION:
APPLICANT: SIA, Charles D.Y.
APPLICANT: KLEIN, Michel H.
TITLE OF INVENTION: Tandem Synthetic HIV-1 Peptides
NUMBER OF SEQUENCES: 101
CORRESPONDENCE ADDRESS:
ADDRESSEE: Sim & McBurney
STREET: Suite 701, 330 University Avenue
CITY: Toronto
STATE Ontario
                                                                                                MEDIUM TYPE: Fighy disk

CMPUTER: IBM PC compatible

OPERATING SYSTEM: PC-DOS/MS-DOS

SOUTHWER BEACHILD Release #1.0, Version #1.25

SOUTHWENT APPLICATION DATA:

APPLICATION NUMBER: US/08/463,966A

FILING DATE: 05-JUN-1995

CLASSIFICATION NUMBER: 08/257,528

FILING APPLICATION BATA:

APPLICATION NUMBER: 08/03,378

FILING APPLICATION: 424

PRIOR APPLICATION NUMBER: 08/073,378

FILING BATE: 09-JUN-1993

CLASSIFICATION: 424

ATTORNEY/AGRT INPORMATION:

NAME: STEWART, MICHAEL I.

REGISTRATION NUMBER: 1038-487 MIS:jb

TELECOMMUTICATION INFORMATION:

TELEBHONE: (416) 595-1155

TELEFRAX: (416) 595-1163

INFORMATION FOR SEQ ID NO: 84:

SEQUENCE CHARACTERISTICS:
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 SOFTWARE: Patentin Release #1.0, Version #1.25

Sequence 30, Application US/08462507A

Patent No. 5876731

GENERAL INFORMATION:

APPLICANT: SIA, Charles D.Y.

APPLICANT: KLEIN, Michel H.

TITLE OF INVENTION: Tandem Synthetic HIV-1 Peptides

NUMBER OF SEQUENCES: 101

CORRESPONDENCE ADDRESS:

ADDRESSEE: Sim & McBurney

STREET: Suite 701, 330 University Avenue

CITY: Toronto

STATE: Ontario

COUNTY: Canada

ZIP: MSG IN7

COMPUTER READABLE FORM:

MEDIUM TYPE: Floppy disk.

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

This sequence represents a fragment of novel human chondrocyte integrin subunit alpha-10 (ISa10, see AAY32242), corresponding to the C-terminal cytoplasmic domain of the protein. The invention relates to a recombinant or isolated integrin heterodimer comprising the alpha10 subunit in association with subunit beta (especially beta-1). The integrin heterodimer, or the subunit alpha-10, or a fragment of it such as the present sequence, can be used as a marker or target of all types of cells, e.g. of chondrocytes, osteoblasts and fibroblasts. They can also be used: for treating pathological conditions involving ISa10, such as damage to cartilage, trauma, rheumatoid arthritis or osteoarthritis; for
                                                                                                                                                                                                                                                                                                                                         Integrin alpha-10; ISa10; human; trauma; rheumatoid arthritis; osteoarthritis; osteoarthrosis; cancer; atherosclerosis; inflammation; therapy; cartilage; chondrocyte; osteoblast; fibroblast; vaccine; marker.

physiological or therapeutic reparation of cartilage, or detecting transplantation of cartilage or chondrocytes during transplantation of cartilage or chondrocytes during transplantation of cartilage or chondrocytes and for in vitro scuting, isolating or purification of chondrocytes and for in vitro scuties of differentiation of chondrocytes; and as a target for anti-adhesive drugs or molecules in tendon, ligament, skeletcal muscle or other tissues where adhesion impairs the function of the tissue (all claimed). Isalo binding during embryonic development, anglogenesis or development of cancer, in pathological conditions such as rheumatoid arthritis, osteoarthrosis or reparation of cartilage (claimed). A vaccine comprising the integrin heterodimer or subunit alpha-10 is also claimed. ISalo polynucleotides, vectors, host cells and methods of producing recombinant ISalo are also

The present invention describes a method (M) for producing a monodispersed preparation of a polyanionic polymer (PP) larger than 10 kD. (M) involves inserting into an expression vector (EV) a ligation product formed by ligating together oligonuclectides that encode glutamate/aspartate residues, expressing EV in a host cell, and isolating the protein product (P) of EV, where (P) is PP and at least 80% of PP is approximately of the same molecular weight. Also described: (1) a recombinant fusion protein (I) comprissing a polyanionic polypeptide and another polypeptide at either one end or at both ends of it; (2) a

Producing monodispersed preparation of polyanionic polymer for therapy, by expressing vector comprising ligation product of oligonucleotides encoding glutamate/aspartate residues in host cell and isolating the

Leukine, where the polyanionic polymer is polygiuganic acid or polyaspartic acid; (3) a vector (III) comprising a cassette which comprises a nucleotide sequence encoding a polyanionic polymer and at least one other nucleotide sequence, where the polyanionic polymer is polygiutamic acid or polyaspartic acid; (4) production of (I); (5) a cell (IV) comprising (III) or a vector that comprises a nucleotide sequence that encodes a polyanionic polymer that is larger than 10 kDs, and (6) a recombinantly-produced polyanionic polymer (V) that is of any molecular weight or is larger than 10 kD, and is conjugated to another protein. (I) is useful for treating a disease or ailment in an individual by administering (I) to the individual. (I) is also useful for delivering an effective amount of a pharmaceutically active agent, a therapeutic protein or a drug to a patient in need of it, or for dispnostic and testing or research purposes. AB2222131 and ABB56374 to ABB56400 represent sequences used in the exemplification of the present
                                                                                                                                                                                                                                                                                                                                                                                                                                                           ö

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The present invention relates to a peptide with a series of heptadrepats that mimic a transmembrane domain and a selected cytoplasmic domain attached to the heptad repeats. The invention is useful for evaluating structure and activity of a selected occupied and clustered transmembrane protein with the selected cytoplasmic domain and for identifying therapeutic compounds. It is also useful for identifying a cytoplasmic domain binding partner. It is may be used to study protein interactions with transmembrane proteins such as integrin, which can be used to treat conditions in which over activity of integrins is involved,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Polypeptides useful in construction of structural models for identifying therapeutic compounds, comprises series of heptad repeats that mimic a transmembrane domain and cytoplasmic domain attached to the repeats.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The present invention relates to a peptide with a series of heptadrepeats that mimic a transmembrane domain and a selected cytoplasmic domain attached to the heptad repeats. The invention is useful for evaluating structure and activity of a selected occupied and clustered transmembrane protein with the selected cytoplasmic domain and for identifying therapeutic compounds. It is also useful for identifying a cytoplasmic domain binding partner. It is may be used to study protein interactions with transmembrane proteins such as integrin, which can be used to treat conditions in which over activity of integrins is involved, such as inflammation, thrombosis and malignancy
                                                                                                                                                                                                                                                                                                                                                                                                                                                          Polypeptides useful in construction of structural models for identifying therapeutic compounds, comprises series of heptad repeats that mimic a transmembrane domain and cytoplasmic domain attached to the repeats.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Amino acid sequence of a peptide from the integrin beta-3-subunit.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Human; integrin beta-3-subunit; inhibition; cellular adhesion; cell adhesion regulatory domain; CARD; tumour; inflammatory refibroblast proliferation; coronary disease; vascular disease; respiratory distress syndrome; retinosis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 DB 4;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   AAR88078 represents the human integrin alpha-IIb cytoplasmic domain. It is used to produce a Tac/integrin chimera having the cytoplasmic domain as above covalently linked to the extracellular and transmembrane domain of the Tac subunit of the human interleukin-2 receptor. Chimeric integrins can be used to block the activity of natural integrins in vivo. This provides an alternative route, to using small molecule inhibitors of ligand binding by integrins, of studying and modulating integrin activity in vivo. These inhibitors act on the interaction between intracellular molecules and integrins and are therefore likely to be cell type-specific
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           New soluble protein models of transmembrane receptors - have helical amphiphilic sequence to represent transmembrane domain, also chimeric integrin proteins for inhibiting human cellular integrins.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Gaps

The invention relates to an isolated nucleic molecule that is at least CC 95% identical to 18 human cDNA sequences representing 12 novel genes cented proteins or a polyvucleotide fragment of the cDNA.

CC defined in the specification, its species homologue, a variant or allelic variant of the polynucleotide having a homologue, a variant or allelic variant of the polynucleotide having a polynucleotide capable of hybridising under conditions the polynucleotide, where the polynucleotide does not hybridise under stringent conditions to a nucleic acid molecule combinant vectors, host cells for producing the polynucleotide are recombinant vectors, host cells for producing the polynpetide, the secreted polypeptide fragment, domain, epitope, full-length protein, variant, allelic variant or species homologue, antibodies that specifically bind to the polypeptides, diagnosing treating, preventing or ameliorating amedical condition by administering the polynucleotide or the polypeptide, the gene corresponding to the cDNA sequence and sequence in a cell, isolating the supernatant, and detecting an activity in a biological assay (by expressing the cDNA sequence in a cell, isolating the supernatant, and detecting an activity in a biological condition, for preventing, treating, or a melocation or a susceptibility to a pathological condition, for preventing, treating, or a melocating and antibodies are useful for disorders, neurological and blood clotting disorders (many examples are grown in the specification). The nucleic acids are also useful for certicition mapping. The polypeptides and antibodies are useful for certicition mapping. The polypeptides and antibodies are useful for certicition mapping. The polypeptides and antibodies are useful for certicition mapping. The polypeptides and antibodies are useful for certicition or increase or decrease storage capabilities of fact contriled as encoding integrin alpha 11 subunit. The present sequence is fat content or other unterginal alpha 11 sassay and sequence are separated to
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              subunit. The present sequence is the Integrin alpha cytoplasmic domain motif as found in the gene7 protein
                                                                                                                                                                                                                                                                                                                                                 New human secreted nucleic acid molecules and polypeptides, useful for preventing, treating, or ameliorating a medical condition, such as cancer, inflammation, immune disorders, neurological and blood clotting
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            34.2%; Score 39; DB 6; Le

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ö
                                                                                                                                                                                                                                                                                                                                                                                                                 This is the amino acid sequence of a peptide from human integrin beta-3-subunit, which is used in the method of the invention. This method shrotoves the inhibition of cellular adhesion, which the use of peptides comprising a cell adhesion regulatory domain (CARD) of an adhesion receptor abunit expressed by the cell. The method is useful in treatments requiring inhibition of cellular adhesion e.g. to prevent growth of tumours, since adhesion is required to form tumour masses. It can be used to inhibit cellular inflammatory responses, (especially when the CARD is an integrin beta or alpha subunit), and to the peptide comprises an integrin beta i CARD. The method is useful to treat excessive fibroblast proliferation (especially to heal wounds) when the peptide comprises an integrin beta i CARD. The method is useful to treat coronary and/or vascular diseases, as well as respiratory distress syndrome, and retinosis in the blood
                                                                                                                                                                                                                                                                      Inhibiting cellular adhesion useful e.g. to prevent tumour growth - by introducing peptide(s) comprising cell adhesion regulatory domain of an adhesion receptor or counter receptor sub-unit expressed by the cell.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  cytostatic; antiinflammatory; immunomodulator; neuroprotective; hemostatic; gene therapy; cancer; inflammation; immune disorder; neurological disorder; blood clotting disorder; food additive; preservative; secreted protein; integrin alpha; human.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                     유
                                                                                                                                                                                                                                                                                                               The invention relates to a marker (I) for mammalian mesenchymal stem cells (MSC), comprising an integrin alpha10 and/or integrin alpha11 chain expressed on cell surface of a MSC or intracellular in a MSC. (I) is useful for identification of a mammalian MSC, for modulating differentiation of a mammalian MSC and for isolating a mammalian MSC. (I) is useful for identifying, differentiating and isolating a mammalian MSC from a mixed cell population as useful tools in cell therapy or in repair of damage tissue. The present sequence represents a sequence from the integrin alpha10 cytoplasmic domain which is present in the place of a conserved integrin cytoplasmic domain motif (ADI39444).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ö
                                                                                                                                                                                                                                                    Marker for mammalian mesenchymal stem cells, useful for identifying and isolating mesenchymal stem cells, comprising integrin alpha 10 and/or integrin alpha 11 chain expressed on surface or within the stem cell.

The invention relates to a novel composition comprising a substance that modulates the status of a protein, 121P2A3. The composition of the modulates the status of a protein, 121P2A3. The composition of the invention has cytostatic and immunostimmlant activity, and is useful as a vaccine. The 121P2A3 proteins and polynucleotides are useful for cliciting humoral or cellular immuno response. The polynucleotides are useful for characterising cytogenetic abnormalities of this chromosomal couseful for characterising cytogenetic abnormalities of in the chromosomal region that encodes 121P2A3 that may contribute to malignant phenotype, and in assessing the status of 121P2A3 gene products in normal versus cancerous tissues. The proteins are useful for generating and characterising domain-specific antibodies, for identifying agents or cellular factors that bind to 121P2A3 or a particular structure domain, and in various therapeutic and diagnostic contexts, including cancer vaccines. The antibodies or T cells reactive with the product are useful in passive or active immunisation, and in imaging methodologies for the management of cancer. The sequences shown in ABP813646 - ABP95595 represent peptides from the 121P2A3 variants of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                         New composition comprising a substance that modulates the status of 121P2A3 polypeptides, useful for eliciting humoral or cellular immune responses or in assessing the status of 121P2A3 gene products in normal

The invention relates to a novel composition comprising a substance that modulates the status of a protein, 12192A3. The composition of the invention has cytostatic and immunostimulant activity, and is useful as a vaccine. The 121P2A3 proteins and polynucleotides are useful for eliciting humoral or cellular immune response. The polynucleotides are useful for cuseful for characterising cytogenetic abnormalities of this chromosomal focus, as tools that can be used to delineate cytogenetic abnormalities of in the chromosomal region that encodes 121P2A3 that may contribute to malignant phenotype, and in assessing the status of 121P2A3 gene products in normal versus cancerous tissues. The proteins are useful for generating and characterising domain-specific antibodies, for identifying agents or cellular factors that bind to 121P2A3 or a particular structure domain, and in various therapeutic and diagnostic contexts, including cancer vaccines. The antibodies or T cells reactive with the product are useful in passive or active immunisation, and in imaging methodologies for the management of cancer. The sequences shown in ABB81646 - ABB95595 represent peptides from the 121P2A3 variants of the invention
                                                                                          New composition comprising a substance that modulates the status of 121P2A3 polypeptides, useful for eliciting humoral or cellular immune responses or in assessing the status of 121P2A3 gene products in normal
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Challita-Bid PM, Raitano AB, Faris M, Hubert RS, Mitchell SC;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ò
                                                                                                                                                                                                                                                                                                The invention relates to a novel composition comprising a substance that modulates the status of a protein, 121P2A3. The composition of the cinvention has cytostatic and immunostimulant activity, and is useful as a vaccine. The 121P2A3 proteins and polynucleotides are useful for clicing humoral or cellular immune response. The polynucleotides are useful for characterising cytogenetic abnormalities of this chromosomal focus, as tools that can be used to delineate cytogenetic abnormalities of in the chromosomal region that encodes 121P2A3 that may contribute to malignant phenotype, and in assessing the status of 121P2A3 gene products in normal versus cancerous tissues. The proteins are useful for generating and characterising domain-specific antibodies for identifying cancer vaccines. The antibodies or T cells reactive with the product are useful in passive or active immulsation, and in maging methodologies for the management of cancer. The sequences shown in ABP83546 - ABB85595 represent peptides from the 121P2A3 variants of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ö
                                                                                                                                                                    New composition comprising a substance that modulates the status of 121P2A3 polypeptides, useful for eliciting humoral or cellular immune responses or in assessing the status of 121P2A3 gene products in normal

                                                                                    The invention relates to a novel composition comprising a substance that modulates the status of a protein, 121P2A3. The composition of the invention has eyeoteatic and immunostimulant activity, and is useful as a vaccine. The 121P2A3 proteins and polymucleotides are useful for eliciting humoral or cellular immune response. The polymucleotides are useful for characterising cyrogenetic abnormalities of this chromosomal locus, as tools that can be used to delineate cytogenetic abnormalities in the chromosomal region that encodes 121P2A3 that may contribute to malignant phenotype, and in assessing the status of 121P2A3 gene products in normal versus cancerous tissues. The proteins are useful for generating and characterising domain-specific antibodies, for identifying agent or callular factors that bind to 121P2A3 or a particular structure domain, and in various therapeutic and diagnostic contexts, including cancer vaccines. The antibodies or T cells reactive with the product are useful in passive or active immunisation, and in imaging methodologies.
                                                                                                                                                                                                                                                                                                                                               ö
                                                                                                                                                                                                                                                              for the management of cancer. The sequences shown in ABP83646 - ABP95595 represent peptides from the 121P2A3 variants of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Mcnabb A;

                                                                                                                               The invention describes an isolated polynucleotide and polypeptide useful for stimulating and/or expanding T cells specific for a tumour protein for determining the presence of a cancer in a patient. A composition containing the polynucleotide and/or polypeptide is useful for treating a lung cancer in a patient. The polypeptide is useful for removing tumour cells from a biological sample. The polynucleotide is also useful as probe or primer to detect the level of mRNA encoding a tumour protein. This is the amino acid sequence of a lung tumour associated peptide. This patent did not form part of the printed specification, but was obtained in electronic format directly from MIPO at
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Novel lung cancer polynucleotide encoding lung cancer protein, useful for detecting the presence of lung cancer in a patient, and in pharmaceutical compositions, e.g. vaccines, for treating lung cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The invention relates to a polynucleotide encoding a lung tumour protein,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   cancer; lung tumour; cytostatic; vaccine; T cell expansion;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Gaps

the specification, or a sequence (S2) mentioned in specification, or a sequence serior roughly a sequence serior consisting of at least 20 contiguous residues of s1, sequences having 75*, preferably of $15, sequences hat hybridise to $11, sequences having 75*, preferably of $15, sequences hat hybridise to $13, sequences having 75*, preferably of $15, sequences mentioned in the specification, a sequence an isolated an included are an isolated polypeptide (comprising a sequence fiscal and sequence mentioned in the specification, a sequence monded by the polymorlectide, or sequences having at least 70*, preferably 90*, identify to a sequence encoded by the polymorlectide, an expression control sequence, a host cell transformed or transfected with the vector, an isolated antibody (or its antigen-binding fragment) that the vector, an isolated antibody (or its antigen-binding fragment) that the beach of the polymorlectide polypeptide, an expression control sequence, a host cell transformed or transfected with the vector, an isolated antibody (or its antigen-binding fragment) that the objection of the polypeptide and the polymorlectide aspection or antigen or antigen presenting cells, under conditions and for a time aufficient or antigen-presenting cells, under conditions and for a time aufficient or antigen presenting cells that express the polymorlectide, such that 7 cells from a patient with the polymorlectide, protein or antigen presenting cells that express the polymorlectide, such that 7 cells proliferated from a patient with the polymorlectide, such that 7 cells or composition for simulating and imministering to the patient and electric amount of the patient. The polymorlectide, protein and scales and composition for simulating an immune response in a patient, and for the patient. The protein and oligomorlectide is also useful in pharmaceutical compositions, e.g. vaccines. The polymorlectide is a sled protein and protein and electricing and in the design and protein or primer for nucletic sequence. The polymorl
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      library. The present sequence is an epitope mapping peptide derived from the cDNA L548S isolated from a library derived from lung tumour/cancer cells. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly
a sequence selected from any of the 14 sequences mentioned in
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Gaps

The invention describes an isolated polynucleotide comprising one of 32 sequences, complement or degenerate variants of them. The polynucleotide is useful for preparing a composition e.g. a vaccine or for gene therapy, for treating or inhibiting development of cancer, e.g. lung cancer. This sequence represents a polypeptide associated with the compositions and methods for the therapy and diagnosis of lung cancer
                                                                                                                                                                                                                                                                                                                     New polynuclectide, useful for preparing a composition for treating or inhibiting development of cancer, e.g. lung cancer.

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                 2005, 14:50:40 ; Search time 43 Seconds (without alignments) 38.193 Million cell updates/sec
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Sequence 25,

; Sequence 25, Application US/08073028
; Patent No. 5464933
; GENERAL INFORMATION:
APPLICANT: Matthews, Thomas J.
APPLICANT: Wild, Carl T.
TITLE OF INVENTION: SYNTHETIC PEPTIDE INHIBITORS OF HIV
TITLE OF INVENTION: TRANSMISSION
NUMBER OF SEQUENCES: 74
CORRESPONDENCE ADDRESS:
ADDRESSE: Pennie & Edmonds
STREET: 1155 Avenue of the Americas
CITY: New York
STATE: New York
COUNTRY: USA
                                                                                                                                                                                                                                                                                                                                                                                                 5225193-2
